Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The method uses PCR to amplify these regions followed by sequence-specific oligonucleotide probe hybridisation (SSOPH) using the probes AAX79365-X79429. SSOPH allows detection of polymorphisms that predict differences at a single amino acid level thus reducing errors and improving the chance of successfully matching tissues.
The sequences given in AAT41811-20 represent probes which were used to resolve the human leukocyte antigen (HLA) DRB1 atleles, DRB1*08, *12 and *1404. This probe sequence hybridises to the Gly86 coding region found in alleles *0801, *0802, *0803 and 0805. These probes may be used in the method of invention which concerns HLA typing of a sample for an unknown pair of alleles. The pair of alleles comprises one of two known types which have the same overall set of polymorphisms but have a different distribution of polymorphisms between their two alleles. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Improved method for HLA typing - by DNA amplification and sequence-specific oligo:nucleotide hybridisation, used to select bone marrow dohors
                                                                                                                                                                                  Human leukocyte antigen typing of tissue samples - using allele-specific amplification to distinguish allele pair
                                                                                                                                                                                                                                                                                                                                    01-MAR-1993;

In the second stage, the group or basic type identified determines which set of allele specific primers will be used. The first of the two primers comprises an opt. labeled sequence common to each allele of the group identified in the first stage but different from other groups identified in stage one. The second primer may be a mixture of different labeled primers one complementary to two or more sequences within the group, or the amplification may be performed with only one second primer to detect the presence of a single group of alleles. In the third stage the specific allele is determined. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            method comprises selectively amplifying the DNA of just one allele of the unknown pair and analysing the amplified DNA to determine which polymorphisms are present in that allele, and therefore assigning the unknown pair to the known type having that allele. The method comprise three test stages. The first stage is to establish the number of alleles present in each sample. Primers corresponding to fairly well conserved regions of a locus will increase the likelihood that unknown
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              may be done by amplification or hybridisation using a radiolabelled probe. The method may be used for tissue matching, identifying disease susceptibility, etc. The method of the invention esp. distinguishes between DQB1*0304/DQB1*03032 and DQB1*0301/DQB1*0302.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     probe which undergoes sequence-specific hybridisation with an HLA-DR beta consensus sequence at positions 61-64. The probe contains a labelling substance other than a nucleotide sequence, which facilitates detection of the probe. The HLA sequence of a subject is PCR amplified, and a probe that recognises an allelic polymorphism at a selected HLA locus is contacted with the amplified product. This first probe recognises a HLA-DR beta-allelic polymorphism. A second (different) probe is brought into contact with a second sample of the amplified DNA in a separate reaction, and hybridisation detected. The probes and primers are used for HLA typing, e.g. for tissue, especially bone
                                                                                                  The present invention relates to human leukocyte antigen (HLA) typing The method involves detecting polymorphic residues by sequence specific oligonuclectide probe hybridization (SSOPH) with labeled
                                                                                                                                                                                   Human leukocyte antigen typing by amplifying a sample followed by sequence specific oligonucleotide hybridization with labeled oligonucleotide probes that hybridize with a series of known control DNA sequences -

                                                                                                                                    The sequence is that of the hybridising region of tailed probe DRB15 for use in a method for determining HLA-DR beta sub-type in a nucleic acid sample. The method allows specific nucleic acid sequences of the second exon of HLA-DR beta genes to be amplified then probed for identification of polymorphic sequences. The amplified DNA is useful for typing homozgous or heterozygous samples from a variety of sources and for detecting allelic variants not distinguishable by serological methods. The typing system can be used in a reverse dot blot format which is simple and rapid to perform, produces detectable signals in minutes and can be utilised in tissue typing, determination of individual identity and identifying disease susceptible individuals. Preliminary testing shows that the probe is more preferred than others. The probe is see also AAQ26092-Q26367.

The method allows specific nucleic acid sequences of the second exon of HLA-DR beta genes to be amplified then probed for identification of polymorphic sequences. The amplified DNA is useful for typing homozogus or heterozygous samples from a variety of sources and for detecting allelic variants not distinguishable by serological methods. The typing system can be used in a reverse dot blot format which is simple and rapid to perform, produces detectable signals in minutes and can be utilised in tissue typing, determination of individual identity and identifying disease susceptible individuals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Apple |

The method allows specific nucleic acid sequences of the second exon of HLA-DR beta genes to be amplified then probed for identification of polymorphic sequences. The amplified DNA is useful for typing homozogous or heterozygous samples from a variety of sources and for detecting allelic variants not distinguishable by serological methods. The typing system can be used in a reverse dot blot format which is simple and rapid to perform, produces detectable signals in minutes and can be utilised in tissue typing, determination of individual identity and identifying disease susceptible individuals. It has not yet been tested. See also AAQ26092-Q26367.
                                                   The invention relates to a typing kit for judging human leukocyte an (HLA) genotype of a sample by hybridising a substrate on which 10-24 oligonucleotides (ABL30512-ABL31809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and
containing gene polymorphisms as alloantigens have been immobil primers for amplification of cleaved nucleic acids relating to polymorphisms. The method is useful for judging HLA genotypes c individuals by determining immunogenetic differences before tra

                                 The sequence represents a sequencing primer for DNA encoding the Fusari fungal enzyme, glucanase. Glucanase, endochitinase and exochitinase are polypeptides with cell-wall degrading activity, derived from Fusari fungal genes. The associated nucleic acids can be used to produce transgenic plants which are resistant to plant pathogens, particularly Fusarium species. They can also be used to isolate homologous genes fro fungi to obtain genes which protect host cells, including fungi, bacter and plants against related fungal pathogens. The polypeptides, especial chitinases and glucanases, are useful for degrading seafood waste, such as shells that contain chitin, or for chemical modification of chitin o
                                                                                                                                                                                                                                                                                                                                                    (NOVO)
                                                                                                                                                                                                                                  Fusarium nucleic acids encoding polypeptides having glucanase, endochitinase or exochitinase activity, useful for producing transge plants which are resistant to plant pathogens, particularly Fusarium

                                                                                                                                                                                                              The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonucleotides (ABLJ0512-ABLJ1809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility of diagnossis of genetic diseases and identifying individuals.
                                                                                                                                                                                                                                                                                                                                                                                  Claim 10; Page 139; 345pp; Japanese

                                                                                                                                                                                                                                                                                                                                                    The invention relates to a typing kit for judging human leukocyte antigen (HLA) genotype of a sample by hybridising a substrate on which 10-24 base oligonuclectides (ABL30512-ABL31809) originating in the sequences of genes e.g. belonging to HLA class I antigens on human genome and containing gene polymorphisms as alloantigens have been immobilised as primers for amplification of cleaved nucleic acids relating to gene polymorphisms. The method is useful for judging HLA genotypes of individuals by determining immunogenetic differences before transplanting between them, providing genetic information to decide compatibility of organ and tissue for transplantation e.g. of bone marrow, kidney, liver, pancreas, Langerhans islet in pancreas and cornea, susceptibility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of individuals e.g. by dete

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              for use in a method for determining HLA-DR beta sub-type in a nucleic acid sample. The method allows specific nucleic acid sequences of the second exon of HLA-DR beta genes to be amplified then probed for identification of polymorphic sequences. The amplified DNA is useful for typing homozgous or heterozygous samples from a variety of sources and for detecting allelic variants not distinguishable by serological methods. The typing system can be used in a reverse dot blot format which is simple and rapid to perform, produces detectable signals in minutes and can be utilised in tissue typing, determination of individual identity and identifying disease susceptible individuals.
                            A novel method of typing the human leukocyte antigen (HLA) of the major histocompatibility complex (MHC), esp. for typing donors for bone marrow transplants, involves determining if the donor tissue HLA-DR alleles are selected from the gp.: HLA-DRW52C, DR12a,b, DR3a,n, DR5a-e, DRNew1, DR6a, DR8a-d, DRW53a-c, DR4a-f, DR7, DR9, DR2a-c, B3, DR2a-d, B1, DR10 and DR1a-c. The method uses PCR to amplify these regions followed by sequence-specific oligonucleotide probe hybridisation (SSOPH) using the probes AAX79365-X79429. SSOPH allows detection of polymorphisms that predict differences at a single amino acid level thus reducing errors and improving the chance of successfully matching tissues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Improved method for HLA typing - by DNA amplification and sequence-specific oligo:nucleotide hybridisation, used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    27-JUN-1990;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Conservative
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gil4732114|gblaF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end-repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             nucleic search, using sw model

A putative heterozygous mother tree (clone 10-5) and two open pollinated daughters (half-sib clones 152-231 and 152-257) were crossed to a highly susceptible pollen parent. Progeny were challenged with inoculum from various aeciospore lines. It was found that the marker amplified by the 10-mer primer in AAQ99824 was predictive resistance to inoculation with single Aeciospore line 2-36 in

                                 allele containing the target polymorphisms, (b) labelling the single-stranded nucleic acid molecules, immobilising oligonucleotide probes, each specific for a known polymorphism, on a support and (c) detecting fully complementary duplexes formed between the labelled single-stranded nucleic acid molecules and the immobilised probes. The method is used for determining differences and correspondences in polymorphisms between individuals, tissues or organs by comparing hybridisation patterns produced by the above method. The method uses probe arrays rather than requiring sequential hybridisation and removal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    previous step. The method is userur row userum the previous step. The method is userur row in conting trees of the of resistance to fusiform rust disease and for producing trees of the pinus genus that are resistant to the disease. The present primer was pinus genus that are resistant or identify and amplify resistance.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       progeny trees for a number of genetic markers, identifying genetic markers segregating in a Mendelian ratio and showing linkage with other genetic markers, measuring resistance to fusiform rust disease in multiple progeny trees and correlating the presence of resistance to fusiform rust disease with at least one marker identified in the previous step. The method is useful for determining the genetic basis
                                                                                                                                                   HLA-C allele by detecting polymorphisms using the primers AAX23371-X23380. The method involves (a) preparing single-stranc nucleic acid molecules corresponding in sequence to the portion

Oligonucleotice fragments of (I) are used as probes and primers
                                                                                                                                                                     This invention describes a novel nucleic acid (I) that encodes flavone synthase II (FNSII) which has anticancer and immunomodulatory activity. FNSII catalyses conversion of naringenin to apigenin (I) is used to produce transgenic ornamental plants that have targeted alterations in flower color, also altered content/distribution of flavones in leaves, flowers and other tissues, e.g. increased resistance properties or symbbotic capacity. FNSII expressed by (I) is used in synthesis of
